Transluminal Dilation, aka. Canaloplasty
With or without Goniotomy

Description: This procedure uses a microscopic catheter to unclog the eye's natural plumbing. *Goniotomy* is an incision that opens they eye's natural plumbing (Schlemm's canal). *Transluminal dilation* is an injection of a thick jelly-like fluid that dilates the eye's natural plumbing (Schlemm's canal).

Also known as: Minimally Invasive Glaucoma Surgery (MIGS), Trabecular Bypass Surgery, Canaloplasty

Risks include: Infection, bleeding, inflammation, elevated eye pressure, decreased eye pressure, damage to neighboring structures, need for further surgery

Benefits: Decreased intraocular pressure, decreased dependence on glaucoma medications

Alternatives:

- Observation
- Medications (drops, pills)
- Laser trabeculoplasty
- Minimally Invasive Glaucoma Surgeries (trabecular bypass stent, supraciliary stent)
- Glaucoma Filter Surgery (glaucoma drainage implant, trabeculectomy)
- Laser cyclophotocoagulation
